1. Struktur Stack

```
public class StrukturStack {

private int[] array;
private int top;
private int temp;

public final int MIN = -1;

public StrukturStack(int capacity) { // Constructor untuk menginisialisasi capacity dan array super();
    array = new int[capacity];
    this.capacity = capacity;
    TOP = MIN;
}

public void push(int data) { // Method push untuk menambahkan data ke dalam stack

if (isFull()) {
    System.out.println(x:"Stack penuh");
} else {
    TOP++;
    array[TOP] = data;
}
}
```

```
public boolean isEmpty() { // Method untuk mengecek apakah stack kosong
public boolean isFull() { // Method untuk mengecek apakah stack penuh
    return TOP = capacity - 1;
public void displayElements() { // Method untuk menampilkan elemen ke
    System.out.println(x:"Elemen from TOP:");
    if (isEmpty()) {
        System.out.println(x:"Stack kosong");
        for (int i = TOP; i \ge 0; i--) {
            System.out.print(array[i] + " ");
public int pop() { // Method pop untuk mengeluarkan data dari stack
    if (isEmpty()) {
       System.out.println(x:"Stack kosong");
        return MIN; // Mengembalikan nilai MIN untuk menandakan stack
        temp = array[TOP]; // Menyimpan nilai TOP ke dalam variabel temp
   return temp;
public int top() { // Method untuk mengecek apakah stack kosong atau tidak
    if (isEmpty()) {
       return MIN;
       return array[TOP];
public int size() { // Method untuk mengecek ukuran stack
```

```
public int size() { // Method untuk mengecek ukuran stack

return TOP + 1;
}
```

2. Stack Main

```
public class StackMain {
    Run|Debug

public static void main(String[] args) {
    StrukturStack stack = new StrukturStack(capacity:3);

// Sebelum push

System.out.println(x:"Sebelum push");
System.out.println("Size: " + stack.size());

System.out.println("Empty: " + stack.isEmpty());

System.out.println("Full: " + stack.isFull());

System.out.println("Top: " + stack.top());

stack.displayElements();

System.out.println();
```

```
// Melakukan push 3x

System.out.println(x:"Melakukan push 3x:");

stack.push(data:2);

stack.push(data:4);

stack.push(data:1);

System.out.println("Size: " + stack.size());

System.out.println("Empty: " + stack.isEmpty());

System.out.println("Full: " + stack.isFull());

System.out.println("Top: " + stack.top());

stack.displayElements();

System.out.println();
```

Output Latihan Push:

```
Sebelum push
Size: 0
Empty: true
Full: false
Top: -1
Elemen from TOP:
Stack kosong
Melakukan push 3x:
Size: 3
Empty: false
Full: true
Top: 1
Elemen from TOP:
1 4 2
```

```
// Melakukan pop 1x
System.out.println(x:"\nMelakukan pop 1x:");
stack.pop();
System.out.println("Size: " + stack.size());
System.out.println("Empty: " + stack.isEmpty());
System.out.println("Full: " + stack.isFull());
System.out.println("Top: " + stack.top());
stack.displayElements();
System.out.println();
}
```

Output Latihan Pop:

```
Melakukan pop 1x:
Size: 2
Empty: false
Full: false
Top: 4
Elemen from TOP:
4 2
```
